Davao del Sur, Davao City, PH

EDUCATION

Ateneo de Davao University — *Bachelor of Science in Computer Science* Davao City, PH | June 2026
Awards: President's Lister (2022-2023), Dean's Lister (2023-2024, 2026)

SKILLS

Programming Languages: TypeScript, JavaScript, Python, Java
Frontend: Next.js, React.js, Vite, Tailwind CSS, shadcn/ui, TanStack Table, HTML
Backend: FastAPI, NestJS, REST API, RBAC, JWT
Databases & ORM: PostgreSQL, Supabase, Prisma, SQLAlchemy
AI/ML: RAG Pipelines, Groq, Hugging Face, LLMs, NLP, Langchain
Developer Tools: Git, GitHub, Postman, Bruno, Docker, Swagger, Claude Code, Cisco Packet Tracer
Certifications: Cisco Certified Network Associate (CCNA), Cisco Network Security
Spoken Languages: Cebuano, Tagalog, English

PROJECTS

Retrieval-Augmented Chatbot for Traffic Regulations — *Undergraduate Thesis* GitHub | Demo
React, Vite, Tailwind, FastAPI, PostgreSQL, Groq, Hugging Face, LLMs, NLP

- Achieved 75-77% response relevance in human evaluation by building a retrieval-augmented chatbot using LLaMA3-8B via Groq API grounded on Philippine traffic regulation documents.
- Mitigated LLM hallucination risks by implementing an embedding similarity search pipeline that goes through 20+ documents to retrieve relevant contexts before generating responses.
- Implemented conversation memory management with 6-message context windowing to preserve dialogue coherence, and constructed a 79-question evaluation suite to benchmark retrieval accuracy across varying query complexity and regulatory domains.
- Post-thesis, upgraded the RAG pipeline to Llama 70B via Groq API and increased text chunking from 200 to 1000 tokens with 200 token overlap, significantly reducing hallucinations and improving response accuracy.

Healthcare Management Information System — *Commissioned Academic Project* GitHub | Demo
Next.js, TypeScript, PostgreSQL, Supabase, Prisma, shadcn/ui, TanStack Table

- Delivered a full-stack healthcare management platform for cancer patients in collaboration with MARIAN-TBI (DOST-incubated startup), implementing a 5-role RBAC system (Patient, Caretaker, Doctor, Medical Staff, Admin) with middleware-enforced route protection and Google OAuth authentication.
- Designed a polymorphic task management architecture supporting 5 clinical categories (medication, treatment, appointments, exercise, general) with priority queues, prerequisite chaining, and delegated access patterns enabling role-based task manipulation on patient records.
- Integrated Supabase SSR for secure session handling and built dynamic data tables using TanStack React Table with server-side filtering, enabling real-time clinical data visualization backed by middleware-based, role-scoped access control to segregate sensitive patient data.

Vehicle Management System — *Clever Kobweb* GitHub
FastAPI, React, Vite, SQLAlchemy, JWT, TanStack Table

- Built a full-stack vehicle fleet management system from the ground up, using FastAPI's async endpoints for concurrent vehicle data operations and React Query for optimized client-side state management.
- Implemented cookie-based JWT authentication with bcrypt password hashing and RBAC authorization for Admin/Staff roles, and designed a custom, lightweight audit logging system from scratch to track user actions and record data changes for accountability.
- Built responsive data grids with TanStack Table featuring multi-column filtering, pagination, and real-time search, reducing data retrieval latency through SQLAlchemy's async engine and asyncpg driver optimizations.

Book Management System — *RESTful API Backend* GitHub
NestJS, TypeScript, PostgreSQL, Prisma, Zod Validation

- Developed a REST API following clean architecture principles, implementing CRUD operations for books and authors with Prisma ORM for type-safe database queries and advanced filtering on title, author, and publication metadata.
- Secured endpoints using native NestJS guards and role-based access control, following official NestJS security best practices, and added request validation with Zod alongside bcrypt password hashing for user authentication flows.
- Implemented a flexible tagging system for book categorization and authored comprehensive API documentation with Swagger integration for endpoint testing and consumption.

EXPERIENCE

Clever Kobweb — *Software Developer Intern* Remote | May 2025 – June 2025

- Independently delivered a full-stack Vehicle Management System end-to-end, meeting 100% of client requirements within a 200+ hour development timeline.
- Owned authentication and security design, including cookie-based JWT sessions, bcrypt password hashing, and RBAC authorization across Admin/Staff roles.

Ateneo SAMAHAN System Developers — *Backend Developer* Davao City, PH | August 2025 – June 2026

- Collaborated with a student development team building backend services for internal university systems using robust API design patterns and cloud-native deployment strategies.
